

The GE Vivid 5 ultrasound machine is used in many hospitals and medical establishments, and for good reason. It provides an amazing level of image quality. The overall initial image quality as well as the available image enhancement capabilities of this machine gives technicians the tools needed to obtain incredibly accurate information from the raw data. Contrast imaging is one feature of the GE Vivid 5 machine that is quite helpful. This increases the echo strength, allowing superior evaluation of even difficult-to-image patients. The GE Vivid 5 also offers Quantitative tissue velocity imaging, which captures moving images dynamically so as to keep them as high-quality, vividly-colored images. One of the stand-out features of the GE Vivid 5 is its customized report generation. Data and patient reports can be presented, stored, and generated however the ultrasound user would like. This information can be customized either at the scanner machine or at a separate workstation.
